Problem Statement

Input:

<Describe the input format, type, or data you receive>

Output:

<Describe the expected output based on the input>

Example:

Input: <example input here>

Output: <example output here>

Brief explanation of the problem tackled in the paper or project.

Clearly describe what the model/system is supposed to solve.

Motivation

- Why did you choose this problem?
- What makes it interesting, impactful, or challenging?
- Is there a real-world application or gap this project addresses?

Literature Review

- Brief background and prior work related to your problem.
- Key papers or methods that inspired your approach.

Dataset

Example Data Instance:

- (Show a sample input/output pair or a data row)

Statistics:

- Number of samples, classes, features
- Class balance
- Dataset source (give proper citation/link)

Distribution Graph (if possible):

- You can include a histogram or pie chart for class distribution.

Method/Technique

- Describe the model architecture or approach used.
- Include a diagram if applicable (e.g., neural network architecture, pipeline).
- ***Explain the intuition: why this method? What does it capture?***
- Mention implementation details: libraries, parameters, training strategy.

Results

- Your model's performance metrics (accuracy, precision, etc.) and score obtained.
- Comparison to benchmark or baseline.
- Tables and graphs work well here!

Analysis

- Discuss qualitative insights from your results.
- Are there any interesting patterns, trends, or cases that stood out?
- Brief visual examples can help (e.g., attention heatmaps, output samples).

Error analysis

- Examples of incorrect outputs or failure cases.
- Try to explain *why* those errors occurred?

Improvements over the paper

- What did *you* contribute that's new?
- How did you enhance or extend the original work?
- Even small tweaks, ablation studies, or novel visualizations count.

Learnings

- Summarize your learnings.
- Key takeaways from the project.
- What did you learn technically?
- What did you learn about problem-solving, teamwork, or experimentation?

Demo

- A **fully functional GUI demo** is mandatory.
- **No marks** will be awarded for the demo if the interface is missing or not working.

Summary and Conclusion

- Brief recap of the problem
- Main conclusion or insight.
- Any potential future work or open challenges.
